

Replace InfoPath[®] With FlowForma

Remove Your Dependency on Redundant InfoPath Technology with FlowForma

In January 2014, Microsoft announced that their investment in InfoPath had come to an end. With many companies heavily invested in InfoPath as a solution for electronic forms, it's now the time to move towards new technology designed for the web-savvy and mobile workforce.

The Challenge

Microsoft will cease support for InfoPath in 2024, but a greater concern may be that InfoPath does not offer features that maximize the benefits of modern technology. Therefore, technical solutions built on InfoPath are inferior to those built on modern platforms.

Migrating InfoPath solutions onto alternative platforms can seem a daunting task. FlowForma Process Automation accelerates the migration of business process steps and form fields in one simple environment.

The FlowForma Approach

Dedicated to making the complex simple, FlowForma recommends using our no-code designer, which allows you to build replacement forms in a fraction of the original time, with built-in form features that grants better end user experience.

For large scale InfoPath replacements, involving many InfoPath forms, FlowForma can accelerate the migration. The FlowForma tool can accept an InfoPath form template as an input, interpret the template and auto-populate fields onto steps and questions. Users can then adjust the mapping to accurately replicate the form function and finishing touches can be applied in FlowForma using the no-code designer.

FlowForma vs InfoPath

FlowForma Process Automation accelerates migration as it

- allows secure access to forms from anywhere using your web browser.
- stores information centrally and securely in SharePoint.
- provides built in workflow and no need for external workflow.
- is a no-code model removing the need for assistance from IT.
- builds forms which are accessible on desktop and mobile devices.
- generates documents with ease, including all your form data.
